

Interim Report feedback:

Overall good work. Having seen your work and prototype, my main comment here would be to please add more detail to your report. I have seen much work in the presentations over the previous term which I feel could have been presented in the report as well.

Good effort at contextualising the product. Depth and context of the problem space could be unpacked in more detail. For example, a review of existing products, what they do, what they are missing, where your proposed prototype stands in relation to them (along with references and citations).

Good description of requirements analysis. Though the absence of user input stays stark, the continuous iterative sessions with the industry partner is a good method for requirements gathering but providing more detail around this, maybe a summary table or an explicit account of the different iterations and respective changes made after each stage as per requirements analysis would help here.

Good effort with the software work. The product integrates several different aspects, so having an overall architecture diagram (and referencing it within the text) would help. Good evidence of use of version control. Data management is talked about but again going into the details about the DBS approaches adopted would help.

Figures are blurry and challenging to read, including higher quality images would help the report. Project management is well done! Frequent (productive) meetings, well recorded. More evidence of cross training and skills transfer would also help here. Good reflection and identification of concerns. Also, good effort with reactive measures to efficiently address concerns and mitigate future risks.

Good writing style, overall the report is well structured, though use of better visuals and their active integration into the report text would help improve the quality of the report. The conclusion says : "Moving forward, the team will stay dedicated to refining prototypes, optimising systems, and addressing identified challenges to ensure the successful delivery of the final solution of a fully developed mobile and desktop web app to Eviden."

Unpacking this to explicitly state how you would be refining the prototype, optimising the system, summarising the challenges and how you intend to address them would strengthen the report.

Wishing you the best!

——— What she said in the meeting: ———

- Some images were blurry - make sure they are crystal clear in the next one - shared word doc
- Make sure that the graphs are used and talked about in the report - throughout the report, not just the beginning

Written By Andreas Sergiou

- Depth and context of the problem space could be unpacked in more detail - We missed the initial research on the existing space for our project. We didn't contextualise the project - how we solve the issue at hand or build upon an existing solution.

- Requirements Gathering:

- To get higher marks, we could have provided more detail on the iterative development of the requirements - the development of the requirements - summary from each session, what we learnt and how we developed them - we only showed the final result, still good but showing development would have been better

- Initial Software implementation & Testing

- Make sure that all the stages of refinement - data and images - are recorded and used in the final report - so different iterations of the project and how we changed it

- Extra info:

- Details were just said for the sake of it and not given examples - GIVE EXAMPLES
 - Can use bullet points sometimes
- MAKE SURE THE FINAL REPORT HAS FUTURE PLAN - HAS THE SAME RUBRIC

What we can do - Neelima will contact Geert about the changes that we had to make because of the company contact and how it will affect our grades - she said it probably won't as she will take it into account (we can also write it in our report and how we had to adapt to the change - may get us more marks?)

- Send a reminder to Neelima next week if she hasn't done it

————— **Feedback on my CV** —————

- The feedback on Moodle - Good work. Integrating relevant experience with the (software) skills acquired would help the CV improve.

- When people look at CVs

- It's not about the number of languages - integrate them in the experience - so write them in the experience.

- Not just preliminary experience.

- Can have a new section on the CV called Projects and talk about uni modules can talk about the stuff that you did - team admin for software engineering.
