

V1 – Loading screen and log-in System. This is the first initial version of the web application. The first screen is what the user of the software will see when they first press the application. The next page is the login page, which is where the user will enter their login details and be allowed to progress to the next stage if they are correct.

V2 – Addition of Dashboard and all elements in it. In this version, I have added the initial dashboard design and a functional menu.

V3 – Addition of Account Page. I have added the Account Section to this prototype, allowing the user to change any personal details they have provided and log out of the app. These frames are all connected to the previous frames that have been made.

V4 – Addition of Settings Page. I have now added the settings page so the user can update the appearance of the app, managing notifications, navigating to the account page and the FAQ page.

V5 – Added Help & FAQs pages with example sections, which can be clicked to display FAQs or a search bar for querying FAQs (Both not implemented in prototype). Underneath is a set of (example) contact information which can be used to access Eviden's support services.

V6 – Added Data Manager page, displaying an example of a company's energy sources and how much they use each one. Also shown is a monthly target indicator which displays how close they are to meeting their target for the month when aiming to use energy for more renewable sources. This also comes with an - Update Data button which will allow the user to input their own data.

V7 – Continuing of from V6, additional pages were added to allow the user to enter data and select an energy type. Once the submit button is pressed, the user will be notified if their data has been successfully (or unsuccessfully in the full version) added.

V8 – Added A.I. page, allowing the user to select which A.I. Model they would like to use, displaying suggestions and allowing the user to search for one, and what use case they would like to use which must be queried. On clicking the submit button, a short loading icon will appear to show the data is being processed and the results will be displayed.

V9 – Updated names on all pages from "iPhone 13 & 14 - #" to names indicating the purpose of each page. Each page with "(Tab)" after its name is a page which contains a side tab that allows for quick navigation to other important pages within the app.

V10 – Continuing on from V8, A Generated Model page is added to display the results of the processed data. This includes the use case and model that was used, along with the approximate future gain from improved energy savings, estimated amount of energy reduction and estimated cost to implement.

V11 – Settings pages; Appearance, Notifications and Security are added, each with toggleable options along with other customisable options on other pages. In this prototype none of the settings are interactable however this will be fully functional when finally implemented.

V12 – Ensured all pages were connected as intended for a seamless experience.

V13 – Added "Edit Data" button to Update data and Data Added pages. Currently it has no functionality, but this can be implemented in future versions.
