

31/3/2024 - Team 39

- Had a discussion between the backend team(Humais and I) and decided that we wanted to use supabase to create the database
- Implemented tables following Andreas' database schema using supabase alongside Humais

<https://prnt.sc/6G7UzaDCApxA>

- ran into a small error whilst adding the foreign keys to link the tables together

<https://prnt.sc/0JiLQG1XkaiJ>

- overcame the problem by creating a unique ID/constraint on the ID

Constraints

☒ **Is Primary Key**
A primary key indicates that a column or group of columns can be used as a unique identifier for rows in the table

☐ **Allow Nullable**
Allow the column to assume a NULL value if no value is provided

☒ **Is Unique**
Enforce values in the column to be unique across rows

CHECK Constraint Optional

e.g `length(journeyId) < 500`

- ran into an error where, the schema visualiser wasn't displaying the relations properly
- This was due to the reference being to the wrong table, managed to find the error and fix it

public

Select a table to reference to

employeeTable

Select columns from public.employeeTable to reference to

public.departmentTable public.employeeTable

departmentID → departmentID

Add another column

? Which action is most appropriate?

Action if referenced row is updated

Cascade

Cancel Save

- created the database schema in supabase;

<https://prnt.sc/nx6O1wCE2MC4>

- Potential tasks that we need to do going forward:
 - Learn flask to be able to link the MLM front end with the backend database
 - Task for Dixon
 - Continue working on the user auth and overall database - Humais
