

Minutes Document 20

Date: 22/02/2024

Time: 1:00 PM - 2:30 PM

Location: Computer Science Building, Jubilee Campus, University of Nottingham

Present (in order of attendance):

- **Andreas** - Team Admin
- **Aaron** - Deputy Team Admin
- **Humais** - Git Helper
- **Jacob** - Deputy Team Leader
- **Mateusz** - Git Admin
- **Daniel** - Deputy Git Master
- **Martin** - Team Leader

Agenda:

- Welcome and introduction (1 minutes):

- Call the meeting to order
- Converse with present team members
- Briefly introduce the purpose of the meeting

- What needs to be discussed (4 minutes):

- All go round and update on what has been done in each team
- UI Team:
 - The Menu system has been updated and reimplemented in the webapp, small minor changes have been made as well - the small eye icon to show the password temporarily
- AI Team:
 - Bottleneck with the AI dataset - looked at the use cases we came up with at the start of the semester - have done some research on use cases
 - Backend Team - Doing research on React for now so that they can understand how the code works and how to connect the front-end React to the backend

- What was discussed and decided (60 minutes)

- Ideas with data set/Use Cases
 - 1) **Energy consumption - company level**
 - 2) **Solar Panels**
 - 3) **How much carbon emissions are made from traveling to work** - Can also ask people in person - in forms, can populate the tables that the ai is trained on with this info
 - Input data for the AI - method of transport and time taken
 - Can use a maps api to get the distance traveled
 - Makes the individual accountable for their carbon emissions
 - Working from home vs working in office - in stats
 - Find the individual stats for if people drive - ask them the model of their cars - pull the carbon efficiency of their car - Mati found a good dataset
 - Addition - if the company has an overall carbon goal for a month, the webapp can help them meet those goals.
 - A google form that will contain a few questions, like how they got to uni, how long it took them.
- Future Projections

- Potential Idea - based on user input - put it on a bell shaped curve - if they are in a smaller percentile, then they should be issued with warnings/comments.

4) ESG ratings of individual companies

5) Energy output based on computers based on model in a company

- Homework (15 minutes):

- Fill in the template given to us by Martin and explore the idea of data driven sustainability for - How much carbon emissions are made from coming into and leaving
 - All the data points that we can explore
 - Then the datasets that we can find - what data we can use to train the model and real world data we can collect.
 - How this will be a good idea
 - Overlap is good
 - Can also write down more use cases if they come up with them

- Deliverables (15 minutes):

- The template discussed above - Everyone to do this - the homework
 - Compare them and find the points the AI team wants to progress.
 - For Monday 26th

- Martin:

- Download react and look at the webapp
- Ask what the AI algorithm James suggested in the meeting
- UI and Backend team carry on with what they are doing

- Andreas:

- Contact James with the meeting minutes and ask the questions we have

Next Meeting: Thursday 29th February- Time: 1:00PM - Place: Computer Science Building
