Dear BrowneJacobson Team,

We are writing to express our interest in participating in a project that may revolutionise how legal contracts are created and reviewed. We are thrilled and delighted for the opportunity to work alongside such a prestigious company as BrowneJacobson.

Our Alignment with Browne Jacobson's Vision:

As a team, we are eager to apply our abilities and ambitions to this project. We all have a passion for using cutting-edge technology to simplify complex, everyday processes. We are committed to making legal work more effective and precise. Collaborating with a respected organisation such as yours perfectly aligns with our values and aspirations. We firmly believe that this partnership will not only improve what we can offer but will also redefine legal contracting, efficiently and considerately offering services to a wider audience.

Our Understanding of the Brief:

We understand that your company's principles are key to the application of the project. With your commitment to building an organisational culture that is inclusive, ambitious, collaborative, practical, and fair, we acknowledge our ability to achieve this. We identify that the project's aim is to create an interactive chat portal that streamlines the legal contract formation process, beneficial to a wide array of users.

As the team leader of Team 39, I offer a distinct blend of skills, merging a robust background in computer science with a comprehensive

understanding of finance and business. My familiarity with legal frameworks, born out of collaboration with solicitors and in-depth contract navigation, serves as a cornerstone for the solutions we aim to develop. Not only will we utilise cutting-edge technology, but we will also address the nuanced complexities of real-world legal operations.

Through Objectives and Key Results (OKRs) and continuous feedback loops, we will maintain an agile, focused, and highly motivated team.

Team 39 itself is a diverse group of individuals, each contributing a unique skill set. Our proficiencies span Web Development, including HTML, CSS, JavaScript, PHP, and SQL, and extend to creating responsive, user-friendly interfaces with a strong grounding in UI/UX and Human Computer Interaction. Beyond that, our team has in-depth technical capabilities in programming languages such as Haskell, ARM, C, Java, Python, and a thorough understanding of AI technologies. We've also conducted substantial research into 'Cleverbot,' presenting our findings to industry experts.

Conversely, we have extensive project management experience, including the development of E-commerce web applications using the Flask micro web framework. Our customer service experience applies an empathetical approach to resolve user needs, and we have a substantial comprehension of Software Engineering principles. Additionally, our team boasts strengths in project planning, strategy development, and presenting. We all possess experience in working on group projects both academically and professionally. We have studied existing competitor products, such as Zoho Contracts, which has allowed us to identify what features our final product must contain and the standard it must meet.

Our Proposed Approach to BrowneJacobson's Legal Contracts Project:

Our proposed approach utilises the suggested software and services, aiming to create a cutting-edge interactive chat portal that serves its purpose while ensuring security, accuracy, and user satisfaction.

- **System Design and Architecture:** We will choose a cloud-based infrastructure (AWS, Azure) for hosting, ensuring high availability, scalability, and security.
- **Interactive Questionnaire Development:** We will develop a dynamic questionnaire system using HTML, CSS, and JavaScript with conditional logic for branching questions. In addition, we will implement data validation and backend support using technologies like Node.js and MySQL for accuracy.
- **Contract Drafting Tool Implementation:** We will develop algorithms using NLP libraries (spaCy, NLTK) to transform questionnaire responses into professional legal contracts. We will utilise document generation libraries (Docxtemplater, DocuSign API) allowing for manual editing, and version control systems (Git) for collaboration.
- **Upload and Review System:** We will integrate a secure file upload system (Dropzone.js) and text parsing using NLP tools for processing and uploading legal documents. This will also include contact details for users to consult a lawyer, integrated with communication APIs.

- **User Interface & Experience Design:** We will create an intuitive and responsive design (HTML, CSS, JavaScript) with clear navigation and tooltips for guidance.

- **Security & Data Protection Measures:** Using SSL/TLS encryption protocols, we will implement secure user authentication with role-based access control to ensure the system is secure and complies with data privacy regulations.

- **Feedback & Reporting System:** We will design a user-friendly interface catering to all user types and implement a user feedback form using languages such as HTML, CSS, JavaScript.

- **Ongoing Support and Updates:** We will provide ongoing support through integrated chat and emails for real-time user assistance and feedback incorporation.

Clear Communication and Organisation:

As a team, our philosophy lies in clear communication and careful planning. For example, all meetings are accompanied by rigorous documentation, consisting of meeting minutes, and documentation of tasks delegated to subgroups within the team, as well as various details about each task. This allows clear communication to thrive and keeps the group informed on any decisions and the direction the team is moving in.

Thank you for considering our Expression of Interest; we look forward to discussing our collaboration in more detail.

Kind regards,

Team 39
