Dear MHR team,

We have been captivated by your '*Transforming everyday learning into lifelong skills*' project and are eager to highlight why we are the best team to deliver the results you desire. We are heavily impressed by the fact MHR is ranked as one of the top 10 payroll service providers and has a 98% customer loyalty.

Why We Wish To Work With You

As a team, we are all actively involved in personal development and have collectively recognised that learning through informal content such as podcasts, videos and articles is often more desirable than

traditional methods like physical books or in person courses.

Unfortunately, a key issue with consuming informal content is often its lack of credibility and certification. So, a learning app that acknowledges and certifies knowledge gained from informal sources is the perfect project we would like to work on, as it can be a massive assistance for people

looking to add more credentials to their CVs & personal records.

Potential features like competitive leaderboards, summarisation of articles and inspired content recommendations for users can lead to a vast increase in effective learning. We believe interactive and innovative methods such as these can be vital for all age groups and can offer a better, more enjoyable alternative to traditional methods of learning.

We also wholeheartedly connect with your existing products '*iTrent*' and '*People first*' because they are ultimately designed for people who want to save time & money as well as boost their productivity.

We are passionate about these values and believe that we can carry the same ethos for this project.

Our requisite skillset

- Strong understanding of machine learning via '*fundamentals of Artificial Intelligence*' module.
- Extensive research in AI, where a member has delivered a strong presentation to experts in a previous project.
- Members have gained vital skills like strong teamwork, excellent communication, and leadership via vast experiences in high profile working environments, essential for group work.
- Excellent programming experience in a plethora of coding languages.
- Strong understanding of database systems via '*Databases and interfaces*' module.

Our Plan and Approach to the Project

We wish to implement an agile methodology inside a scrum framework given the complexity of this

project. Initially we are planning to interact with stakeholders, potential users, and experts to explore

the specific requirements and expectations this project may entail.

Our Preliminary approach for the development phase:

- Collect data from podcasts, articles, videos, and other content sources via web scraping tools like BeautifulSoup.
- Create a database system through MySQL, a software our team is vastly experienced in, to store content and other history.
- Through NLP libraries and LLMs, manipulate content for categorisation and analysis for processes like article summarisation.
- Ask users to create profiles to record their progress and interactions so via machine learning, recommendation systems can generate additional content tailored towards the users' interests.
- Award users with certificates and badges to validate their learning.
- Implement additional gamified features such as leaderboards to encourage competitiveness.
- Incentivise users to provide continuous feedback via a feedback loop system.
- For the overall development of the app, we are considering using tools like 'react' or 'flutter'.

A key concern is the fact there are multiple types of informal content people consume which can be difficult to handle. We wish to tackle this by streamlining the machine learning process where content like podcasts and videos are converted into transcripts.

Our Challenge to Competitors

Through continuous iterative development and improvement, we want to:

- Gather valuable consumer feedback.
- Create security protocols to ensure account safety and data protection.
- Improve the learning app based on feedback from the MHR team.

These processes will ensure we produce a high quality, fully functioning product.

Gamification is a core element of this project, and we thoroughly want to implement exciting features users will enjoy. Other apps like Quizlet encourage users to share custom made flashcards with each other. We can exceed and improve this feature by encouraging users to set challenges, quizzes, and games for each other based on the content they have consumed, where they can potentially wager in app currencies like medals or points.

These currencies can be potentially used to unlock extra features inside the app, incentivising users to immerse themselves deeper into a positive learning environment.

Summary Of Our Proposal

As a team we possess the essential technical skills, relevant experience, and unique innovative ideas to successfully launch your exciting learning app. We are inspired by your ethos, existing products and overall would love to work alongside your team. We greatly appreciate you for considering our expression of interest and are eager to hear from you soon.

Warm regards,

Team 39

Date of Submission:	18 th of October 2022
Date of Pitch:	26 th of October 2022
